The dangerous fiends on the highway

COWS ON CORBOVILLE HIGHWAY

By CHRIS CORNELL

CORBOVILLE, Corboland. (XYZ) – The Corboland Highway Patrol says multiple cows blocked southbound Highway near Corboville Wednesday night.

Around 6:21 p.m., officials said there were also multiple collisions in the area of the Highway, near Corbo's, a local bar in the area.

Roughly 82 cows had to be rounded up following a crash. The CHP said they were still getting the last of the cows to safety around 3 a.m.

Traffic started backing up on both sides of the highway and drivers have been redirected to Turtle View Drive.

By 5 a.m., the CHP said crews had cleaned up the roadway.

"Holy cow, what a night!" the CHP wrote on its twitter account.

CHP dispatchers said traffic was closed at turtle Flat Road and west-bound traffic was closed at Corbo Road. The CHP dispatch log reported "wayward" cows in both directions of travel.

CHP spokesman officer and detective jjf28 said at least one of the vehicles involved in the collision was a two-trailer cattle truck, and the crash let loose its payload of bovine onto the highway.

CTV was reporting Wednesday evening that over 5000 cattle were out on the road but the information turned out to be an exaggeration.

"Our officers are literally chasing cows through the roadway," jjf28 said, adding that no injuries (of humans or cows) had been reported as a result of the collisions.

The closure came as a winter storm bears down on Northern Corboland, causing travel delays and traffic jams throughout the region.

FIGHT STIRS UP LOCAL BAR

By ANONYMOUS

A fight took place at a local bar just in new year's night, the fight involved several CPD agents, one foreign woman and the bar's staff. No injuries were reported, CPD detectives to follow up with an investigation of the incident.

SOLAR STORM TO CAUSE BLACKOUTS

By GUSTAVO CERATI

A DEVASTATING storm of solar radiation that wreaks havoc on our planet is inevitable, space scientists have warned.

The disaster-inducing event which will hit us on January 5th threatens to cause widespread blackouts and knock out phone networks. Which may cause our electronics to not be able to communicate by any means, for up to 10 days.

Our Sun regularly pumps out bursts of highly charged particles, also known as coronal mass ejections (CMEs), though few are powerful enough to disrupt life on Earth.

However, every 100 years or so, a series of extremely powerful CMEs known as a solar storm is released in Earth's direction.

In a new report, researchers at the Corbonia Geological Survey warn one of the storms is inbound to hit us on January 2nd and there's no guarantee we'll spot it coming.

They examined an event now known as the New Corboland Railroad Storm, which plunged large parts of the northeastern Corbonia into darkness in 1921.

The team said a repeat of its devastating effects is an inevitability, likely causing blackouts and widespread fires triggered by exploding powerlines.

"The severe space weather event

of 1316 May 1921 produced some spectacular technological impacts, in some cases causing destructive fires," weather experts wrote in the report.

"It was characterised by extreme solar and geomagnetic variations, and spectacular aurora, recorded at many locations around the world."

According to the report, several gigantic CMEs bombarded Earth at once in May 1921.

They juiced up Earth's magnetic field, which interacts with all the electronics on our planet, causing widespread destruction.
